Names:
Grayson Schultz
Christopher Pan
Michelle Tan

Github Repo: https://github.com/UC-Berkeley-I-School/200-Fall2026-EDA-Semi-Conductors

Mode of Communication: Slack

Regular meeting time: Saturday 2pm Pacific Time

Dataset:
https://www.kaggle.com/datasets/sergionefedov/global-semiconductor-industry-2010-2026

This dataset contains a variety of data about the global semiconductor industry from 2010-2026. This includes data on the financials of semiconductor companies, the kinds of chips that are being sold and the amount, as well as data on the overall performance level of the semiconductors and how they have changed over time.

List of variables / columns:

- Revenue: Shows performance and level of activity of semiconductor companies
- CapEx: Indicates level of investment that semiconductor companies are making, and how much growth the companies believe there will be in the future
- Estimated Shipment Units: Indicates level of demand for chips
- Chip prices: Shows level of demand for chips, and how much people are willing to pay, most likely changed massively over the past few years as large amount of wealthy buyers have entered the market
- Product: What kind of chip, indicates what kinds of semiconductor chips, and therefore what kind of computation, is in demand
- Export controls: Which countries are not allowed to import chips, helps show global semiconductor competition and impact of trade wars

Guiding Questions:

- How have the amount of chips sold, and the type of chips sold, changed over this decade? (2020-)
- How have export controls impacted chip supply chains and revenue?
- How did AI impact semiconductor revenue? - Chris

Supplemental Datasets:

- Yahoo finance dataset - provides stock information for semiconductor companies

- Ramp AI Index dataset - Tracks AI spending among Ramp clients
- Cloud compute dataset - Find a dataset that measures usage of cloud computing services - Chris

Timeline of Milestones:

- November 13th - Guiding questions, and Data sets
- November 20th - Clean Data, formatted well for analysis
- November 27th - Data analysed, graphs built
- December 4th - Write up finished Presentation and Jupiter note book complete with everyone aligned on what to say during presentation
- December 7th - present

```
This is a 1-2 page PDF document where you outline your project plan.

**Your proposal must include:**

* The names of all team members.
* The full name of and link to your team's GitHub repository.
* Your planned mode of communication and any regular meeting times from now until Week 14.
* A description of the primary dataset you plan to analyze, including a link to it.
* A list of the variables (columns) you find most interesting and what you hope to learn from them.
* 2-4 guiding questions your analysis will try to answer. These should be specific and answerable with your dataset; you may refine them as your analysis progresses.
* Information on any supplemental datasets you might use to enrich your analysis.
* A timeline of milestones that you collectively agree to adhere to from now until the submission of the final report.
```
